Project overview

Overview

The Sustainable Geocommunities program is spearheaded by the University of Minnesota's Research Computing unit. In its early stages, the program's goals are to award seed grants and build partnerships at local, national and global level.

To support these goals, Matogen Digital will develop a website based on the [DSI website](#). Where possible and relevant, we may also leverage prebuilt functionality on other UMN Drupal websites, including [MSI](#), [GEMS Informatics](#) and [IIB](#).

During the course of this initial phase, we will also start planning our work around SGC's brand identity and communications strategy.

Project deliverables

Phase 1: Preparation

- Set up development environments
- Finalise a site map and page structure

Phase 2: Content and web development (early April launch)

- Identify pages required for an April launch
- Produce website content
- Make required adjustments to existing modules and site infrastructure
- Create website pages and upload content

Phase 3: Content and web development (post launch)

- Clarify brand and communications requirements
- Complete remaining website content and development
